Operation Assessed	Operation of Ground Robots, including Legged, Tracked and Wheeled Robots
--------------------	--

Associated with specific area

-  Basement 2
-  B2 029 (Robotics Lab)
-  CTP

Description of work area and/or activity assessed

This risk assessment covers the routine operation, testing, demonstration, maintenance, and movement of ground robots used in the Kinesis CTP laboratory and associated controlled test areas. This includes legged, wheeled, tracked, and hybrid mobile robots used for research, teaching, demonstrations, data collection, payload testing, tele-operation, autonomous navigation, and experimental activities. Tasks may include pre-use checks, battery installation/removal, powering on/off, manual control, autonomous operation, emergency stop testing, payload mounting, transport, charging preparation, and post-use inspection.

Reason for Risk Assessment

To identify, assess, and control health, safety, collision, crushing, entanglement, battery, electrical, fire, equipment-damage, public-interface, and operational risks associated with the use of ground robots during research, testing, demonstrations, and routine laboratory activities.

Overall Current Risk

Moderate Risk

Average Number of Persons Affected

5	 Employees
2	 Machine Operators
3	 Trainees / Young Persons
2	 Visitors

Current Rating	Hazard Information	Task Status
Low Risk	⚠️ Electricity Ground robots may contain batteries, power distribution systems, chargers, motors, sensors, onboard computers, and electrical wiring. Damaged cables, exposed terminals, incorrect charging, short circuits, or unauthorised access to internal components may result in electric shock, burns, arcing, fire, equipment damage, or unexpected robot behaviour.	0 0 0
	Measures Currently in place to prevent risk of injury - Only trained/authorised users operate, charge, or maintain the robots. - Robots, batteries, chargers, cables, and connectors are visually inspected before use. - Damaged wiring, exposed terminals, faulty chargers, or abnormal battery conditions are reported and the equipment is removed from service. - Power is switched off before connecting/disconnecting batteries, payloads, chargers, or electrical accessories where practicable. - Manufacturer instructions are followed for powering, charging, connection, and shutdown. - Battery charging is carried out under the rechargeable battery charging RA/SOP. - Users do not open or modify electrical systems unless authorised and competent.	

Potential Rating	Additional Controls Required
Low Risk	No Remedial Actions Entered If there are any reasonably practicable actions which can be taken to reduce the risk associated with this hazard please use the form above to enter them.

Current Rating	Hazard Information	Task Status
Moderate Risk	⚠️ Moving Parts Ground robots may move unexpectedly or under manual, remote, semi-autonomous, or autonomous control. Wheels, legs, joints, actuators, tracks, arms, payloads, or the robot body may cause impact, crushing, trapping, pinching, entanglement, or collision injuries to operators, nearby personnel, visitors, equipment, or property.	0 0 0
	Measures Currently in place to prevent risk of injury - Only trained/authorised users operate the robots. - Pre-use checks are completed before operation, including robot condition, batteries, payloads, sensors, controls, and emergency stop where fitted. - Robots are operated only in approved areas with suitable space and clear separation from people, obstacles, fragile equipment, and trip hazards. - Speed, force, and operating mode are kept appropriate to the task and environment. - Operators maintain supervision and remain ready to stop the robot if unsafe movement occurs. - Emergency stop, remote stop, or power-off methods are identified before testing begins. - Non-essential personnel are kept away from the operating area, especially during autonomous tests. - Hands, feet, loose clothing, cables, and tools are kept clear of wheels, legs, joints, actuators, and pinch points. - Testing is stopped if people enter the operating area or if the robot behaves unexpectedly.	

Potential Rating	Additional Controls Required
Moderate Risk	No Remedial Actions Entered If there are any reasonably practicable actions which can be taken to reduce the risk associated with this hazard please use the form above to enter them.

Current Rating	Hazard Information	Task Status
Low Risk 	Fire Ground robots are powered by rechargeable batteries and may contain high-current electrical systems, motors, controllers, chargers, and power electronics. Battery damage, overcharging, short circuits, overheating, crash impact, electrical faults, or misuse may cause smoke, fire, thermal runaway, toxic fumes, or damage to the robot, nearby equipment, or the laboratory.	0 0 0
	Measures Currently in place to prevent risk of injury	
	- Batteries are inspected before use for swelling, leakage, heat, odour, corrosion, physical damage, or abnormal condition. - Damaged, swollen, leaking, hot, crashed, or suspect batteries are not used or charged. - Batteries are charged only using compatible chargers and approved battery-specific settings. - Battery charging is covered by the rechargeable battery charging RA/SOP. - Robots are monitored during operation for unusual smell, smoke, overheating, alarms, battery warnings, or abnormal behaviour. - Work areas are kept clear of unnecessary combustible materials during robot operation and charging preparation. - Robots are powered down and isolated if overheating, smoke, odour, battery warning, or electrical fault is observed, where safe to do so. - Fire alarm, extinguishers, emergency procedures, and evacuation routes are available in the lab.	

Potential Rating	Additional Controls Required
Low Risk 	No Remedial Actions Entered If there are any reasonably practicable actions which can be taken to reduce the risk associated with this hazard please use the form above to enter them.
